

Truck Idling Time Guidelines for Your Town's Truck Drivers

All truck drivers should turn off engines when they reach their destination.

During daily start-up, trucks should idle in accordance with the engine manufacturers' requirements and no longer than necessary to bring them to proper operating temperature.

When idling is necessary to run the engine for safety equipment or passenger comfort, truck drivers should limit idling time according to state regulations as follows (based on outside air temperature):

Above 32 degrees F:	5 minutes
Between -10 and 32 degrees F:	15 minutes
Below -10 degrees F:	No limit
